Appointment Write-up

By: Wahu Ngugi

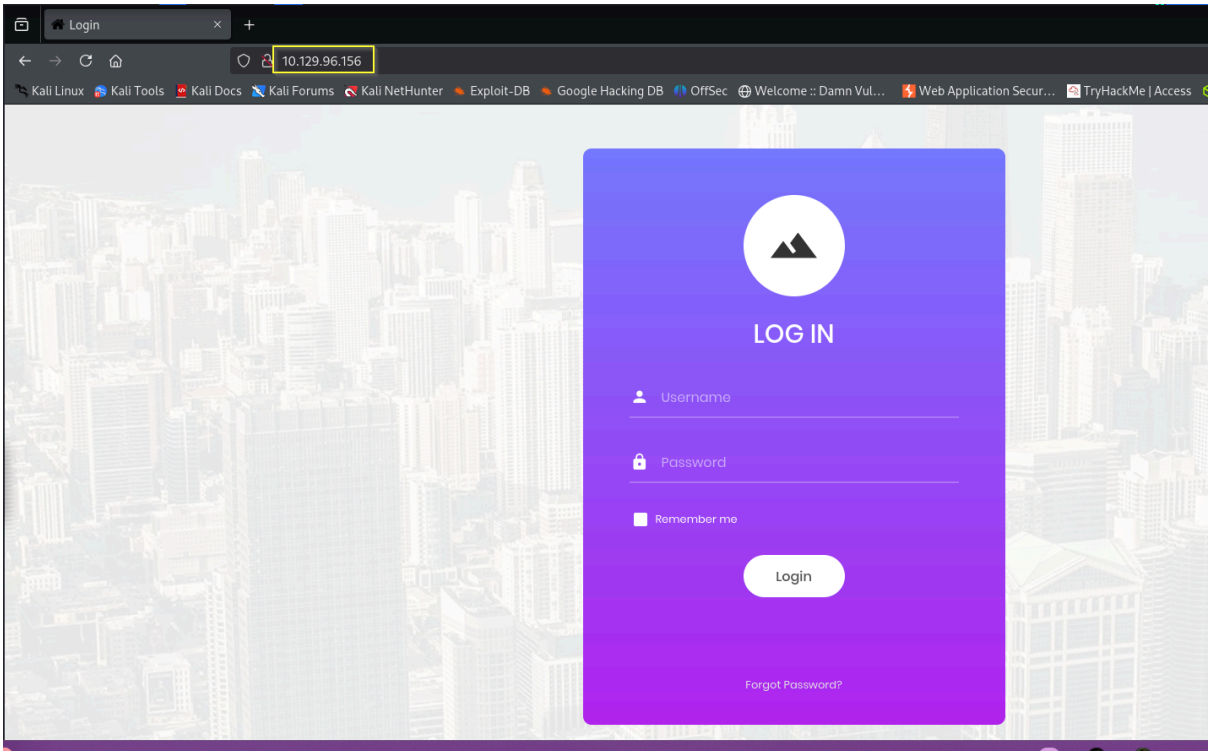

Enumeration

Tools: nmap

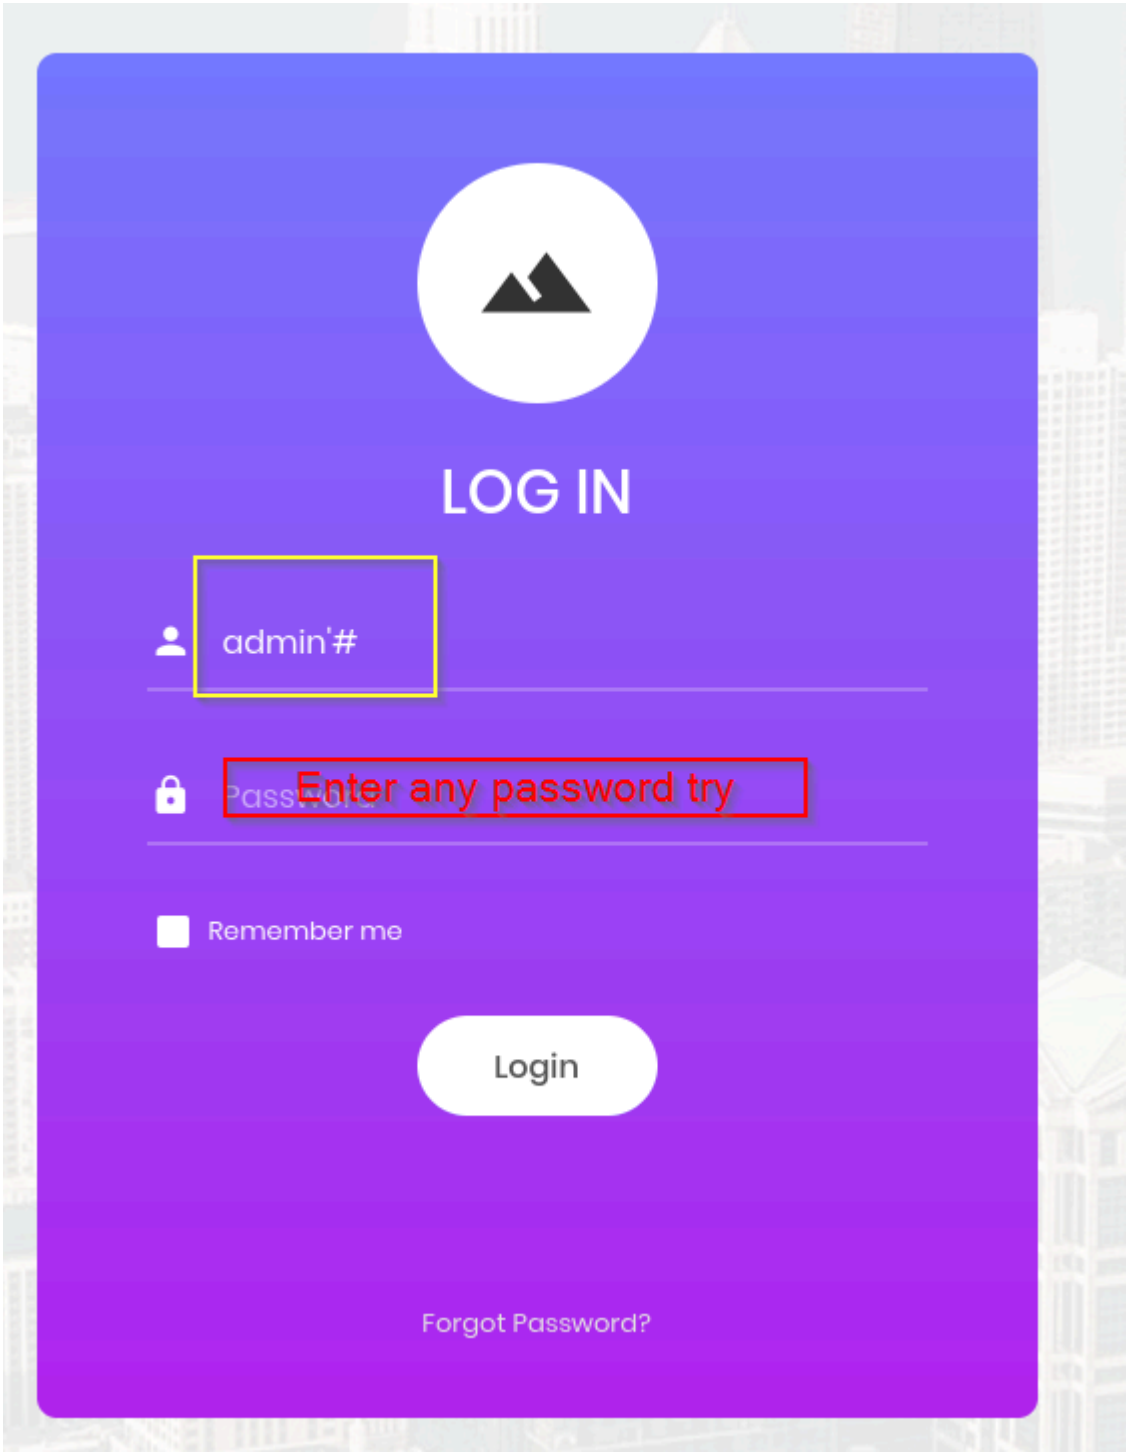

- -sC: Performs a script scan using the default set of scripts.
- -sV: Enables version detection, which will detect what versions are running on what port.

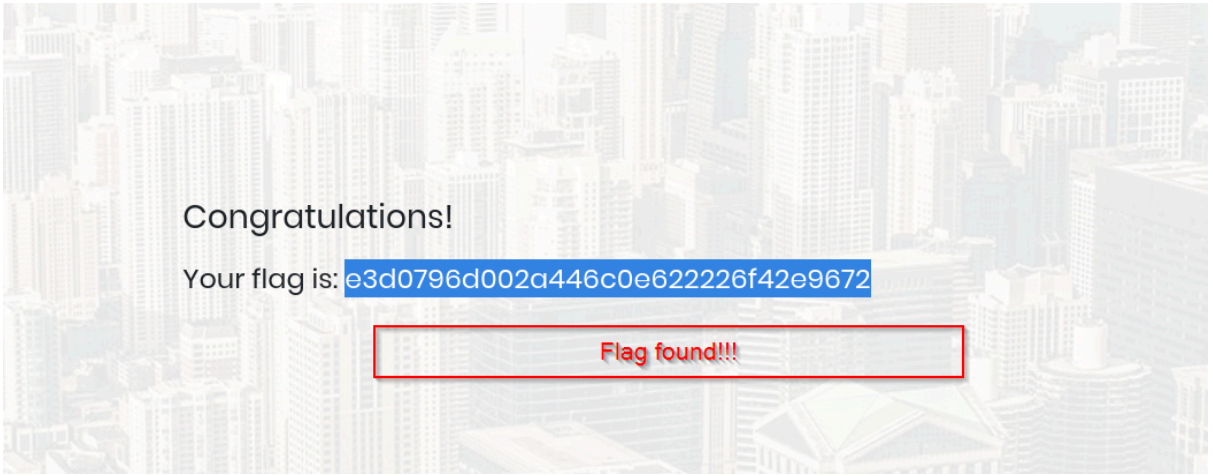

- The only open port detected is port 80 TCP, which is running the ***Apache httpd server version 2.4.38***
- navigate directly to the IP address of the target from our browser

- Since we are not aware of any specific credentials that we could use to log-in, we will check if there are any other directories or pages useful for us in the enumeration process.
- On initial look at this interface, I tried several default passwords but none worked.
- The next step is to try an SQLi exploit

- The input admin’#
- We will close the query with that single quote, allowing the script to search for the admin username.
- The hashtag will comment out the rest of the query, which will make searching for a matching password for the specified username obsolete.

- Flag was found proving that the website is vulnerable to SQLi.
